SOP: Automated Training Coordination Workflow

Version: 1.0 | **Owner:** Training Lead | **Backup owner:** [Name] | **Review:** every 6 months

1. Purpose

Describe how the training registration process runs, who owns it, and how to maintain it, so that registrations, invites, reminders and follow-ups happen without manual admin and anyone on the team can keep it running.

2. Components and flow owners

Component	What it does	Owner	Backup
SharePoint site "Training Team Repository"	Holds Sessions, Registrations, materials, SOP	Training Lead	[Name]
Microsoft Form (Registration)	Collects name, email, department, session	Training Coordinator	[Name]
Flow A: Registration	Capacity check, confirm or waitlist, invite, Teams post	Training Lead	[Name]
Flow B: Reminders	Daily 9 AM emails for tomorrow's sessions	Training Coordinator	[Name]
Flow C: Post-session	Feedback link / no-show follow-up / manager notice	Training Coordinator	[Name]
Flow D: Weekly summary	Monday summary to training lead	Training Lead	[Name]

Flows live in the solution "Training Automation" so they can be exported and moved together.

3. How to add a new session

1. Open **Sessions** list, **New**. Fill Title, SessionDate, Trainer, Mode, Capacity, TeamsLink. Leave SeatsTaken = 0.
2. Open the Registration Form, question **Session**, add a choice with text **identical** to the Title.
3. Upload materials to **Training Materials / [Course]**.
4. Submit a test registration with a test account; confirm Confirmed status, invite, and Teams post. Delete the test row and reset SeatsTaken.

To close a session: set Capacity = SeatsTaken, or remove the choice from the Form.

4. How to fix a failed run

1. A failure email is sent to the training lead automatically (flow name, run link, error).

2. Open the run link in Power Automate (My flows / Solutions) and find the red action.
3. Common causes and fixes:
   - **Session not found:** Form choice text does not match Sessions Title. Correct either and resubmit.
   - **Connection expired:** open flow, Connections, re-authenticate.
   - **Calendar/email error for one person:** invalid email. Correct the Registrations item.
   - **Seats count wrong:** edit SeatsTaken manually in Sessions (Confirmed registrations count).
4. Use **Resubmit** on the failed run (do not resubmit if the Registrations item was already created, to avoid duplicates; check first).
5. Log the issue and fix in the "Incident log" below.

5. Access and permissions

Group	Permission	Members
Training Owners	Full control	Training lead + backup
Training Members	Edit	Trainers, coordinators
Training Visitors	Read	Managers, wider team

Registrations list has unique permissions (Owners and Members only). Flows run under a shared/service account or the owner's connection; at least two co-owners must exist. When an owner leaves, transfer flow ownership before the account is disabled.

6. Data retention and governance

- Registrations contain personal data (name, email, department). Collect only what is needed.
- Retain registration records for **12 months** after the session, then delete or anonymise (use a SharePoint retention label or a scheduled review). Confirm period against company policy.
- Aggregated counts (Flow D) may be kept longer as they contain no personal data.
- Do not email registrant lists outside the organisation; do not post email addresses in Teams.
- Only approved Microsoft 365 connectors are used. No third-party connectors without IT approval.
- Changes to flows are tested with test data first and noted in the change log.

7. Change and incident log

Date	Change / incident	By
